We are becoming quite fond of the two line menu that you see here on this demo. This menu system uses the core Joomla menu module in addition to a slightly revamped version of the [Y VBB bbcode plugin](#) that was featured on the [Joomla Bamboo blog](#). We have rewritten parts of this plug-in to make it compatible for use in Joomla menu items without the code getting rendered in the breadcrumbs on your site.

For those of you who are new to bbcode, its the code that is traditionally used in forums and some comment systems - or a more in depth explanation from the [BBCode website](#) :

"It is similar to HTML in the sense that in BBCode one does also use `<tag>` tags to format something specific (contained within the tag). In BBCode tags are indicated by rectangular brackets surrounding a keyword, which is in turn transformed into HTML before being delivered to a web browser."

The beauty of this plugin is that it has the ability to transform bbcode anywhere in Joomla.

Joomla's normal behaviour is to either strip out any html or render the actual html markup

whenever you want to add it to fields such as content item titles, menu item titles etc The YVBB plugin on the otherhand, allows you to render html markup in menu items, content titles or any other field that you can normally only affect at a deeper template level.

So when it comes to creating a two line menu item with the core Joomla menu - this plugin makes it very easy.

The following screenshot highlights the syntax we have used on the demo site. You don't of course have to use this exact syntax and you can specify any other type of BB code syntax for your menu items.

The screenshot shows the Joomla! administration interface for editing a menu item. The form is titled "Menu Item Details" and contains the following fields:

ID:	27
Title:	Features[br][i]Find out what makes this template ti
Alias:	joomla-overview
Link:	

As you can see the plugin also renders the BBCode in the joomla admin.
